### Inhalt:

The module focuses on physical, chemical or technological aspects of modification, manipulation and characterization of interfaces. These aspects relate to the research of ideal model systems (surfaces and adsorbates on single crystal surfaces) or real systems, in which the interface plays a crucial role for the respective properties. In all cases, the local electronic and chemical interactions at the interface affect the geometric structure (e.g. adsorption geometry) and consequently the chemical and physical properties.

### Lernziele und Kompetenzen:

Students

- deepen their knowledge in experimental methods and theoretical aspects to describe and characterize interface phenomena

- are familiar with different modern analytical techniques and can employ them in practice
- are able to perform experiments independently and to analyse the data
- are familiar with the model-type description of experimental data and are confident with the model-based description and modelling of experimental data
- will be able to present and discuss their results and actual topics related to interface science in front of a specialist audience.
